

Alfido Tech - Instagram Growth Strategy

Evidence summary, four-week content test, and measurement plan

Posts	Engagements	Avg/Post	Non-follower likes	Active followers
257	16,270	63.3	33.4%	55.1%

What the data says

Photo has the highest observed average engagement, although format differences are small. The leading hashtag candidates (minimum five posts) are **#delicious**, **#beauty**, **#foodie**, **#sunset**, **#stunning**. Existing followers generate 66.6% of likes; the remaining 33.4% is a meaningful discovery opportunity.

Four-week test calendar

Day / time	Format	Objective / KPI
Mon 12:30	Educational carousel	Teach a data/AI concept - saves, comments
Wed 18:30	Photo / project proof	Show outcomes - shares, profile visits
Fri 19:30	Short video / reel	Strong opening hook - reach, discovery
Sun 11:00	Community poll / question	Conversation - comments, active followers

Five growth actions

- 1. Content-mix test:** Use the strongest observed format for most posts; keep 25% as a challenger and compare median engagement.
- 2. Controlled hashtag sets:** Rotate 2-3 observed tags (**#delicious**, **#beauty**, **#foodie**, **#sunset**, **#stunning**) with two niche Alfido Tech tags; compare like-for-like posts.
- 3. Convert discovery:** Add one clear follow CTA and track profile visits to follows, especially from non-followers.
- 4. Engineer conversation:** Ask one focused caption question and respond in the first hour; monitor unique commenters and comment-to-like ratio.
- 5. Close the measurement loop:** Capture timestamp, reach, saves, shares, visits and follows gained; rerun after 30-50 real posts.

Decision rule and limitation

The predictive model is exploratory (best model: Random Forest; holdout ROC-AUC 0.646). Use its scores for prioritization, not automatic decisions. All supplied event timestamps are identical, so historical best weekday/hour cannot be inferred. The times above are test hypotheses; keep or change them only after four weeks of real timestamped results.
